EMPLOYMENT HISTORY

UNIBET | Senior Full Stack Software Engineer | 2025 – Ongoing

Roles and Achievements:

- Built and administered GitOps based Typescript micro services on Kubernetes using event-driven Kafka systems to support multi-jurisdictional deployments in a regulated industry. Created stateless RESTful Typescript APIs with internationalised React frontends in a modular Mini App package configuration.
- Diagnosed and resolved performance issues in DB Client SDK by reviewing core C++ client code, reduced Kafka IO bottlenecks by implementing message publishing buffers, and parallelised HTTP request handler DB queries to improve throughput for highly polled and performance sensitive endpoints.
- Developed front-end components and Backend-for-Frontend (BFF) APIs, centralising client-facing logic to reduce duplication and improve consistency across client applications.
- Owned the end-to-end development of the **Same Game Multi / Dynamic Bet Builder** product, designing a BFF-first architecture that orchestrated downstream APIs and validated session state before persisting changes, resulting in improved client behaviour and reliability.
- Authored an internal database migration tool supporting multiple projects, incorporating disaster-recovery capabilities for index rebuilding and migration script execution to reduce server memory pressure and improve operational resilience during database rebuilds.
- Investigated performance bottlenecks in the MQTT message delivery pipeline, enhancing synthetic performance regression tests to identify and resolve slow message delivery. Extended 4GS service metrics to provide greater visibility into system performance and enable more effective monitoring.
- Resolved MQTT message delivery errors across 4 backend services and MQTT broker, identified and resolved race conditions in client MQTT subscription. Implemented client side MQTT message buffering and used idiomatic React patterns to prevent stale data from being written to React Query cache. Identified and resolved client resubscription bug due to JWT token refresh to support a continuous MQTT message delivery pipeline.
- Rewrote backend and client pipelines from Jenkins to GitLab CI using agentic automation in a repeatable pattern to server the team's 10+ services
- Worked closely with UI and technical management investigating and recording tech feasibility studies on a front end UI rewrite, identified dependencies and planned work parallelization, planned and ran sprint refinements for UI rewrite, guided colleagues with documentation and internal meeting on the patterns to follow during the codebase rewrite. Used LLMs to automate rewriting components and removing technical debt from previous rewrites in preparation of parallelized work I identified previously.
- Conducted cross departmental and external interviews to evaluate potential candidates for the team.
- Worked closely with UI/UX and QA team members for refining tickets further and created scripts and development environment tooling to expose recent changes more easily with colleagues of all technical levels.

BGP GROUP | Senior Full Stack Software Developer/DevOps | 2024-2025

Roles and Achievements:

- Add new features to AWS server-less applications utilizing ECS Fargate, S3, API Gateway, Lambda, RDS, MongoDB
- Plan and oversee architectural changes for compute and memory intensive calculations by adding new clusters with auto-scaling policies, SQS message queues, and stateless APIs for mobile app API
- Replace infrastructure and containerize Heroku application on to AWS EC2
- Integrate Terraform deployments to established web applications across AWS environments
- Assist in refactoring server-less resource intensive backend services to new ECS Fargate infrastructure
- Design, improve and secure CI/CD pipelines in BitBucket, GitHub, Jenkins
- Maintenance, development and support of bespoke web applications

FUTURE STATE SYSTEMS | Full Stack Software Engineer | 2020 –2024

Roles and Achievements:

- Frontend developer (React) responsible for the SDLC of B2B web app for designing and testing data extraction templates against electronic documents
- Researched and implemented new software technologies to improve testing, CI/CD processes, user interaction
- Backend development (Java, Spring) of template management solution reading OCR engine text output
- Designed, implemented, and improved algorithm for suggesting template extraction rules for regex, key-value pairs and custom table extraction rules
- Deploy software solutions integrating with ERP and OCR solutions in on premise customer environments as well as in third-party managed cloud environments
- Implement CI/CD pipelines for front end and back end applications
- Work with stakeholders to improve deployment processes, add features, and optimize application performance
- Application profiling, memory dump analysis, ORM troubleshooting, and application optimization in JVM to resolve issues as scale increased

ARM IT GROUP | Junior Full Stack Software ENgineer | 2019

Roles and Achievements:

- Backend development (C# ASP.NET) of Accounts Payable data enrichment solution
- Design and implement JavaScript canvas (jQuery, HTML5) based image viewer with lasso, magnification, pan, scroll and zoom
- Advocated for, planned and refactored frontend and API to use backend session storage instead of whole object serialization for API calls. Optimized user experience by refactoring state management, which resulted in faster interaction and more efficient performance
- Extend and replicate existing integration modules with on premise/cloud ERP and OCR software packages

THE PHOTOBOOTH GUYS | Remote Technical Support and Developer | 2017 – 2018

Roles and Achievements:

- Created Python based solution to resolve connectivity issues with sending emails/SMS of photos to event guests from DLSR Windows PhotoBooth software
- Created NodeJS web server and custom iPad optimized HTML contact form for NRL State of Origin to meet branding requirements and improve user experience when entering contact details to receive photos
- Design and implement for sale photo booth effects in C/Python, including skin smoothing and foreground/background separation
- Provide remote troubleshooting assistance to on-site photo booth attendants
